Name

1700 Central Park Ave
Flossmoor, IL 60422

Notice of an Unknown Water Service Line Material

On January 1, 2022, the Lead Service Line Replacement and Notification Act (415 ILCS 5/17.12) was signed into law. Per the Illinois statute, all water system owners, including the Village of Flossmoor, must develop a comprehensive plan for replacing these lines by 2042. The Village has submitted an initial draft plan to the Illinois Environmental Protection Agency (IEPA). The law also requires the Village to create a record of lead service lines and deliver notices to residents with service lines that are lead, galvanized (that is /was downstream of a lead service line), or unknown.

During the recent water meter replacement project, the Village tasked its plumbing contractor with identifying and documenting the water service line material that enters every building in the Village to create an inventory. This inventory will inform the Village's comprehensive plan for replacing the lines. **Our records indicate that the Village has been unable to determine the material of your water service line. There is the potential that your water service line is made of lead. Please contact Public Works at (708) 957 – 4100 to learn how to participate in the Village's water service line material inventory. If some portion of the water service line from your home to the water main is lead or is made of galvanized pipe that was or is downstream of a lead pipe, then it will be included in the Village's comprehensive replacement program.** Lead exposure is harmful to human health. The most common exposure to lead is swallowing and breathing in lead paint chips and dust. However, lead in drinking water can also be a source of lead exposure. Note that the Village regularly tests consumers' water for lead and is in full compliance with the Environmental Protection Agency's Lead and Copper Rule. Lead in water usually occurs through corrosion of plumbing products containing lead, such as a lead water service line; however, disruption (construction or maintenance) of lead water service lines may also temporarily increase lead levels in the water supply. Please consider the following preventative measures to reduce lead exposure from drinking water:

Run the Tap Before Use

Lead levels are likely at their highest when water has been sitting in a lead pipe for several hours. Flush this water from your pipes by running the cold water for at least 5 minutes before using. This allows you to draw fresh water from the Village's water main.

Clean Aerators

Aerators are small screens at the tips of faucets. They can accumulate small particles of lead. Remove aerators at least monthly and clean them out.

Use Cold Water for Cooking & Drinking

Always cook, drink and prepare baby formula with cold water from the tap. Lead dissolves more easily into hot water. Boiling of water will not remove lead.

Filter The Water

Many home water filters are effective at removing lead. If you purchase a filter, make sure it is certified to NSF/ANSI 53 and NSF/ANSI 42 for lead removal and that you maintain it properly.

Sample Your Water

Test your water for lead. If you would like to have your water tested, here is contact information for a trusted water-testing lab in the Chicago area: Suburban Laboratories, Inc. – (708) 544-3260. If test results indicate a lead level above 15 ug/L, bottled water should be used by pregnant women, breastfeeding women, young children and formula-fed infants.

Remove Sources of Lead

Identify your plumbing fixtures that contain lead and replace them with lead-free fixtures. You may replace your lead or galvanized service lines at your own expense if you so choose. The Village will be further developing and implementing a comprehensive plan to replace lead service lines within the time period set forth by the IEPA. This plan will include a funding strategy to pay for the lead line replacements, including the commitment to aggressively pursue State and Federal funds that may be available to help offset the cost.

Additional information regarding lead water-service lines can be found on the Village's website: www.flossmoor.org. As information about the Village's future lead service line replacement project becomes available, it will be published on the Village's website.

Health Effects of Lead

Exposure to lead in drinking water can cause serious health effects in all age groups. Infants and children can have decreases in IQ and attention span. Lead exposure can lead to new learning and behavior problems or exacerbate existing learning and behavior problems. The children of women who are exposed to lead before or during pregnancy can have increased risk of these adverse health effects. Adults can have increased risks of heart disease, high blood pressure, kidney, or nervous system problems. For more information on lead exposure, visit the Centers for Disease Control and Prevention's (CDC) website at <https://www.cdc.gov/nceh/lead/>.

IMPORTANT HEALTH NOTICE
